

FORG3T PROTOCOL

Black-box Suppression Quick Test Guide

Simple reviewer workflow for buildgames.forg3t.io

Live app	https://buildgames.forg3t.io
Primary route	/dashboard -> Black-box
Prepared	June 5, 2026

Important scope note

This reviewer flow demonstrates AI suppression, not full AI unlearning. To test AI unlearning workflows, email investment@forg3t.io.

Quick Path

Step	Action	What to use
1	Create account	Go to buildgames.forg3t.io/signup and sign up with email + password.
2	Choose plan	Select Enterprise on the onboarding screen, then continue.
3	Open Black-box	From Dashboard, click Black-box in the sidebar or quick card.
4	Get OpenAI values	Create/copy an API key and copy an Assistant ID from the OpenAI Platform.
5	Run test	Paste values, use synthetic scope text, then run the suppression test.
6	Review evidence	Open Jobs / Evidence to inspect status, verification, exports, and any anchor metadata.

Reviewer Instructions

1. Sign up and choose Enterprise

Open the live app and create a new account. After signup, the onboarding page asks for a package. Choose Enterprise, then continue to the dashboard.

Screenshot 1 - Create a For3t account.

Welcome to Forg3t Protocol

Choose your package to get started with cryptographically verified AI unlearning

**Individual**
Free

- ✓ 5 unlearning requests per month
- ✓ Black-box unlearning (ChatGPT)
- ✓ zk-SNARK proofs
- ✓ Compliance certificates
- ✓ IPFS storage

**Enterprise** ✓

2

Select Enterprise

- ✓ Unlimited requests
- ✓ Black-box & White-box unlearning
- ✓ Advanced zk-SNARK proofs
- ✓ Regulatory compliance suite
- ✓ Priority support
- ✓ Integration integrations

3

Continue to Dashboard

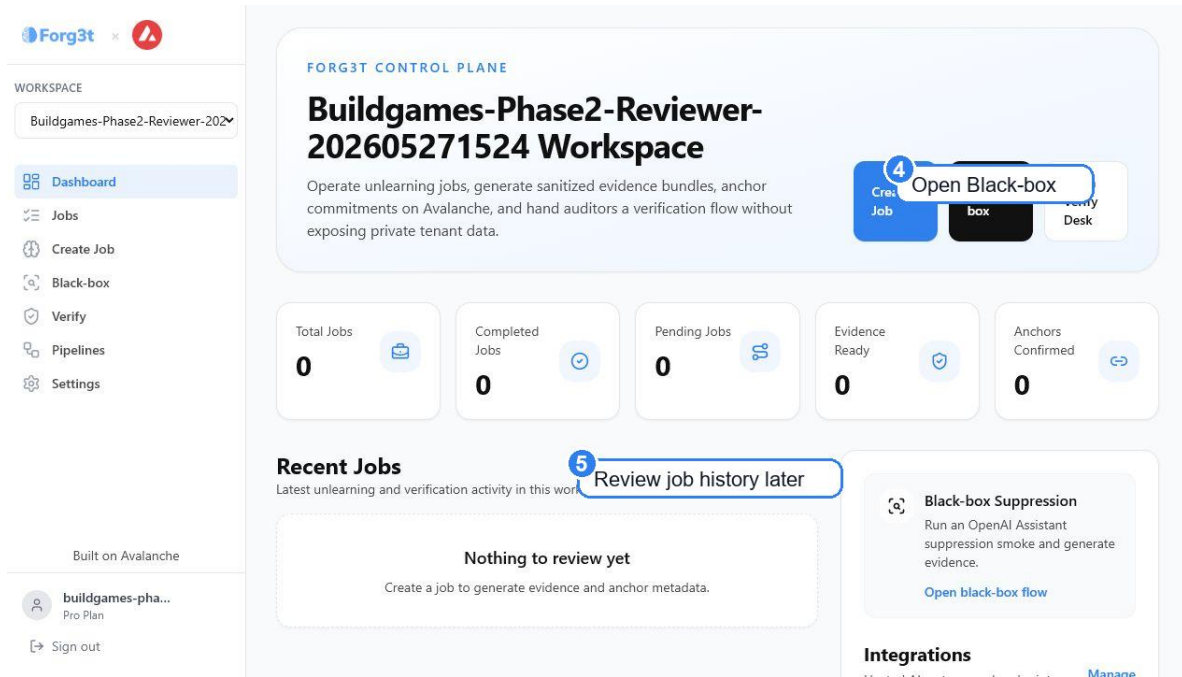

Continue to Dashboard

Screenshot 2 - Select the Enterprise package during onboarding.

2. Open Black-box from the Dashboard

After onboarding, land on the dashboard. Click Black-box from the left navigation or from the dashboard quick action card.

Dashboard link after sign-in: <https://buildgames.forg3t.io/dashboard>

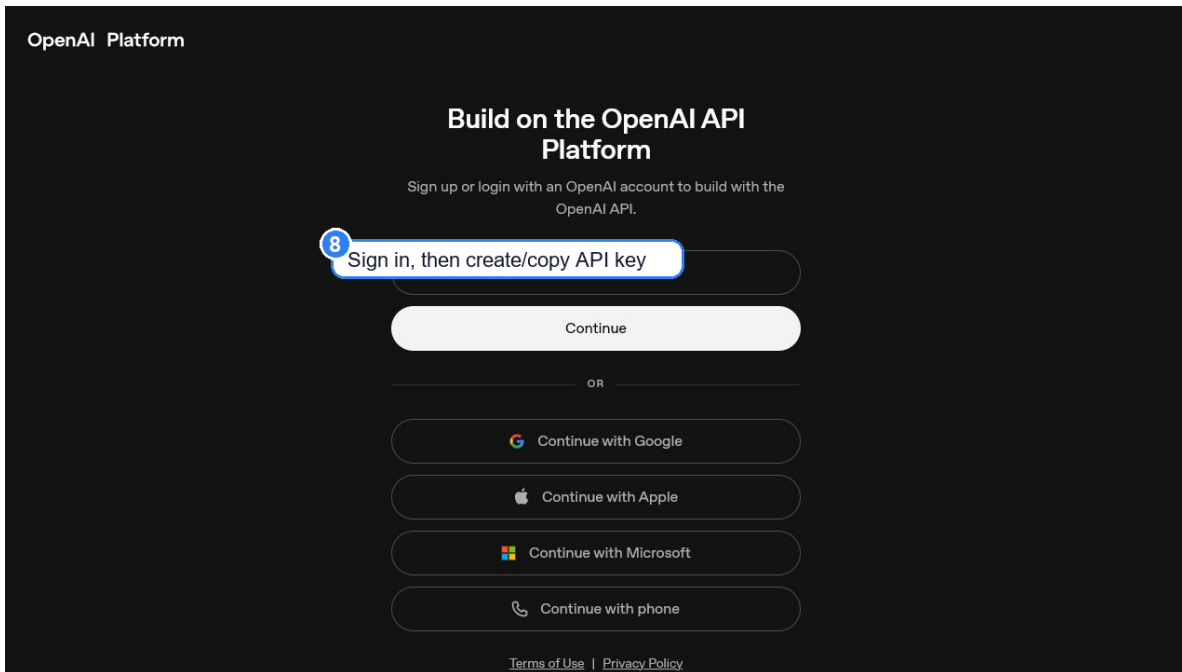

Screenshot 3 - Reviewer dashboard with job history and Black-box entry point.

3. Get the OpenAI values

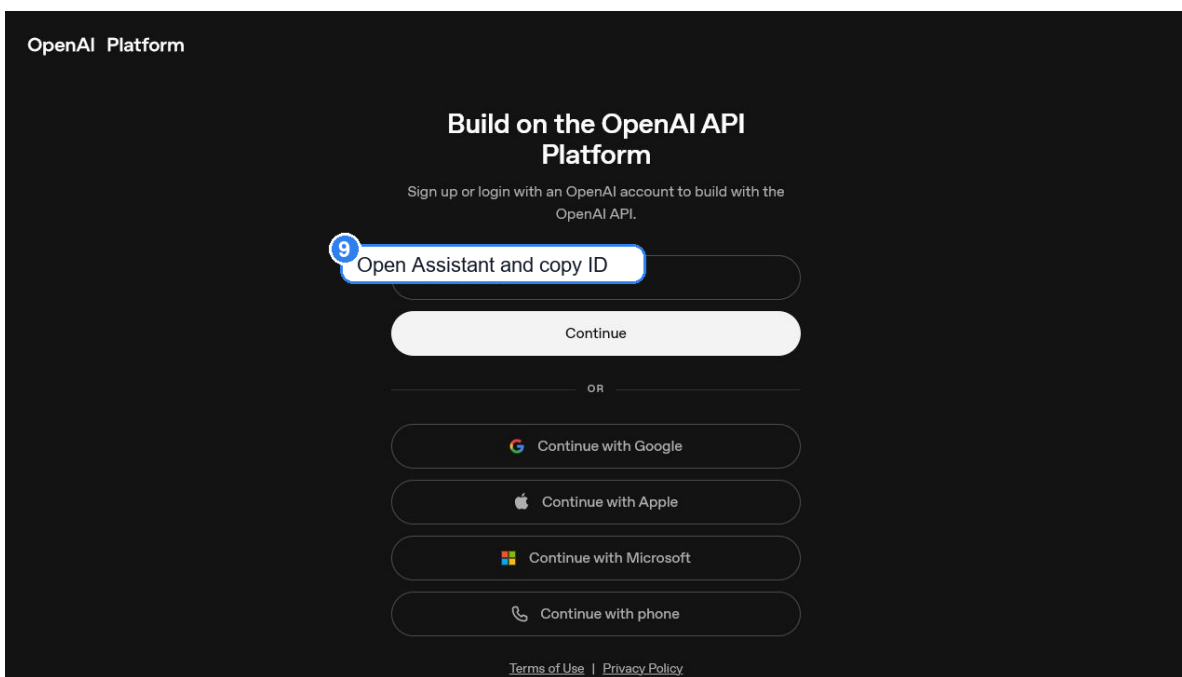

Before running the test, collect two values from the OpenAI Platform. Keep both private and do not paste them into public documents.

Value	Where to get it	Format / note
API key	https://platform.openai.com/api-keys	Starts with sk-...
Assistant ID	https://platform.openai.com/assistants	Starts with asst_...

If OpenAI asks you to sign in, complete the sign-in first, then reopen the same two links.

Screenshot 4 - OpenAI Platform sign-in appears before the API keys page if you are not already signed in.

Screenshot 5 - OpenAI Platform sign-in appears before the Assistants page if you are not already signed in.

4. Run the sample suppression test

Return to Forg3t Black-box. Paste the OpenAI values into the assistant setup area, then use a synthetic request. Do not use private customer data for this quick test.

Black-box link: <https://buildgames.forg3t.io/black-box>

Integration name	OpenAI Assistant
Assistant ID	asst_...
API key	sk-...
Request reason	GDPR erasure / sentiment minimization review
Target scope summary	Suppress responses about the fictional user Ada Mercer in this assistant. Use synthetic test prompts only.

Then click Save and select assistant, complete the request fields, and run the Black-box suppression workflow.

Screenshot 6 - Black-box suppression screen with OpenAI-compatible assistant setup and request fields.

5. Confirm the result

After the run, open Jobs or Evidence. A reviewer should be able to see job status, evidence detail, verification/export access, and anchor metadata when anchoring is enabled for the workspace.

Screenshot 7 - Populated job history and evidence review surface from the Phase 2 reviewer workflow.

Expected outcome

- The reviewer can create or access an Enterprise workspace.
- The reviewer can open Black-box from the dashboard.
- The reviewer can configure an OpenAI-compatible assistant using an API key and Assistant ID.
- The reviewer can run a synthetic suppression request without exposing private data.
- The reviewer can inspect resulting job/evidence records and export or verify available reports.

Reviewer boundary

This quick test is for AI suppression behavior through an observable OpenAI-compatible assistant. It should not be represented as proof that a provider changed model weights or completed full AI unlearning.
